Appearance of Gear Teeth - Terminology of Wear and Failure

ANSI/AGMA 1010-F14

[Revision of ANSI/AGMA 1010-E95]

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing or using products, processes or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretation of this standard should be addressed to the American Gear Manufacturers Association.

CAUTION NOTICE: AGMA technical publications are subject to constant improvement, revision or withdrawal as dictated by experience. Any person who refers to any AGMA Technical Publication should be sure that the publication is the latest available from the Association on the subject matter.

Approved August 8, 2014

ABSTRACT

This nomenclature standard identifies and describes the classes of common gear failures and illustrates degrees of deterioration.

Foreword

[The foreword, footnotes and annexes, if any, in this document are provided for informational purposes only and are not to be construed as a part of ANSI/AGMA 1010-F14, *Appearance of Gear Teeth - Terminology of Wear and Failure.*]

This standard provides a means to describe the appearance of gear teeth when they wear or fail. The study of gear tooth wear and failure has been hampered by the inability of two observers to describe the same phenomenon in terms that are adequate to assure uniform interpretation.

The term “gear failure” is subjective and a source of considerable disagreement. For example, a person observing gear teeth that have a bright, mirrorlike appearance may believe that the gears have “run-in” properly. However, another observer may believe that the gears have failed by polishing wear. Whether the gears should be considered failed or not depends on how much change from original condition is tolerable.

This standard provides a common language to describe gear wear and failure, and serves as a guide to uniformity and consistency in the use of that language. It describes the appearance of gear tooth failure modes and discusses their mechanisms, with the sole intent of facilitating identification of gear wear and failure. The purpose of the standard is to improve communication between equipment users and gear manufacturers for failure and wear analysis. Since there may be many different causes for each type of gear tooth wear or failure, it is not possible in the standard to identify a single cause for each type of wear or failure, nor to prescribe remedies.

AGMA Standard 110 was first published in 1943. A revised standard, AGMA 110.03, was published in 1979 with improved photographs and additional material. AGMA 110.04 was reaffirmed by the members in 1989.

ANSI/AGMA 1010-E95 was a revision of AGMA 110.04. It was approved by the AGMA Membership in March 9, 1995. It was approved as an American National Standard on December 13, 1995.

ANSI/AGMA 1010-F14 is a revision of ANSI/AGMA 1010-E95. It merges ANSI/AGMA 1010-E95 and AGMA 912-A04. New failure modes and additional photos were added and the content was reorganized. The description of failure mode morphology and mechanism was expanded, and methods to reduce the risk of a particular failure mode were added to the description of many of the failure modes.

The first draft of ANSI/AGMA 1010-F14 was made in August, 2010. It was approved by the AGMA membership in June, 2014. It was approved as an American National Standard on August 8, 2014.

Suggestions for improvement of this standard will be welcome. They may be submitted to tech@agma.org.

American National Standard -

Appearance of Gear Teeth - Terminology of Wear and Failure

1 Scope

This standard provides nomenclature for general modes of gear tooth wear and failure. It classifies, identifies, and describes the most common types of failure and provides information that will, in many cases, enable the user to identify failure modes and evaluate the degree or change from original condition.

This standard is based on experience with steel gears; however, many of the failure modes discussed may apply to gears made from other materials.

The solution to many gear problems requires detailed investigation and analysis by specialists and is beyond the scope and intent of this standard.

This standard does not define “gear failure”. One observer's “failure” is another observer's “run-in”. There is no single definition of gear failure, since whether or not a gear has failed depends on the specific application.

The methods given for reducing the risk of a failure mode are specific to the failure mode considered, and implementation may sometimes worsen, or create other failure modes or unintended consequences. Therefore, it is imperative that any remedy be evaluated prior to implementation and thoroughly tested and evaluated after implementation.

NOTE: “gear” throughout the standard means gear or pinion unless the gear is specifically identified.

3 Definitions

3.1 Definitions

The terms used in this standard, wherever applicable, conform to the definitions given in ANSI/AGMA 1012-G05 and AGMA 923-B05.

NOTE: The symbols and definitions used in this standard may differ from other AGMA Standards. The user should not assume that familiar symbols can be used without a careful study of these definitions.

3.2 Classes and modes of failure

Table 1 groups the common modes of gear failure into seven general classes and subdivides the general classes into general and specific modes. It also includes commonly used, but non-preferred names.

Table 1 - Nomenclature of gear failure modes

Class	Clause	General mode	Specific mode or degree	Non-preferred terminology
Wear	4.1	Adhesion	Mild	Normal, running-in wear
			Moderate	Tearing, Microwelding
			Severe (see scuffing)	Scoring
	4.2	Abrasion	Mild, Moderate, Severe	Scratching
				Cutting
	4.3	Polishing	Mild, Moderate, Severe	Burnishing
	4.4	Corrosion		
	4.5	Fretting	True brinelling	
			False brinelling	
			Fretting corrosion	
	4.6	Scaling		
	4.7	White layer flaking		
	4.8	Cavitation		
	4.9	Erosion		Arcing
	4.10	Electrical discharge		
Scuffing	5	Scuffing	Mild, Moderate, Severe	Scoring
				Cold scuffing
				Hot scuffing
				Welding, Microwelding
				Galling
				Seizing
Plastic deformation	6.1	Plastic deformation	Indentation	Bruising
				Peening
				Denting
				True brinelling
	6.2		Cold flow	Permanent deformation
	6.3		Hot flow	Overheating
	6.4		Rolling	
	6.5		Tooth hammer	
	6.6		Rippling	Fish scaling
	6.7		Ridging	
	6.8		Burr	
	6.9		Root fillet yielding	
	6.10		Tip-to-root interference	
	6.11		Tight mesh	
Hertzian fatigue	7.1	Macropitting	Nonprogressive	Contact fatigue, initial
			Progressive	Destructive
			Point-Surface-Origin	Arrowhead
			Spall	
	7.2	Micropitting		Frosting
				Gray staining
				Peeling
	7.3	Subsurface initiated failures		
	7.4	Subcase fatigue		Case crushing
Cracking	8.1	Hardening cracks		Quenching cracks
	8.2	Grinding damage		Grinding burn
	8.3	Rim and web cracks		
	8.4	Case/core separation		Internal rupture
	8.5	Fatigue cracks
