This Volume is a collective effort involving hundreds of technical specialists. It brings together a wealth of information from worldwide sources to help scientists, engineers, and technicians solve current and long-range problems.

Great care is taken in the compilation and production of this Volume, but it should be made clear that NO WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, ARE GIVEN IN CONNECTION WITH THIS PUBLICATION. Although this information is believed to be accurate by ASM, ASM cannot guarantee that favorable results will be obtained from the use of this publication alone. This publication is intended for use by persons having technical skill, at their sole discretion and risk. Since the conditions of product or material use are outside of ASM's control, ASM assumes no liability or obligation in connection with any use of this information. No claim of any kind, whether as to products or information in this publication, and whether or not based on negligence, shall be greater in amount than the purchase price of this product or publication in respect of which damages are claimed. THE REMEDY HEREBY PROVIDED SHALL BE THE EXCLUSIVE AND SOLE REMEDY OF BUYER, AND IN NO EVENT SHALL EITHER PARTY BE LIABLE FOR SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES WHETHER OR NOT CAUSED BY OR RESULTING FROM THE NEGLIGENCE OF SUCH PARTY. As with any material, evaluation of the material under end-use conditions prior to specification is essential. Therefore, specific testing under actual conditions is recommended.

Nothing contained in this Volume shall be construed as a grant of any right of manufacture, sale, use, or reproduction, in connection with any method, process, apparatus, product, composition, or system, whether or not covered by letters patent, copyright, or trademark, and nothing contained in this Volume shall be construed as a defense against any alleged infringement of letters patent, copyright, or trademark, or as a defense against liability for such infringement.

Comments, criticisms, and suggestions are invited, and should be forwarded to ASM International.

Foreword

In this 100th anniversary year of ASM International, it is especially fitting to release *ASM Handbook*, Volume 4A, *Steel Heat Treating Fundamentals and Processes*. Since its 1913 origin as the Steel Treating Club, formed by Detroit blacksmith William Park Woodside, ASM International has grown in scope; yet steel heat treating remains a core subject of the Society. Woodside's vision and recognition of the need to exchange information on steel heat treating are further recognized by many successful publications including the renowned *Metals Handbook*.

The *ASM Handbook* (formerly *Metals Handbook*) series is being expanded into several volumes on heat treatment. This reflects the roots of ASM International, as well as the Heat Treating Society (An Affiliate Society of ASM International) with its ongoing member contributions in the field of heat treating. ASM International and the Heat Treating Society extend a very special thanks to George E. Totten and Jon Dossett as Volume Editors. Their initiatives and contributions were instrumental in the development of this Volume. We are indebted to them and to the subject editors, authors, and reviewers for this publication.

Policy on Units of Measure

By a resolution of its Board of Trustees, ASM International has adopted the practice of publishing data in both metric and customary U.S. units of measure. In preparing this Handbook, the editors have attempted to present data in metric units based primarily on *Système International d'Unités* (SI), with secondary mention of the corresponding values in customary U.S. units. The decision to use SI as the primary system of units was based on the aforementioned resolution of the Board of Trustees and the widespread use of metric units throughout the world.

For the most part, numerical engineering data in the text and in tables are presented in SI-based units with the customary U.S. equivalents in parentheses (text) or adjoining columns (tables). For example, pressure, stress, and strength are shown both in SI units, which are pascals (Pa) with a suitable prefix, and in customary U.S. units, which are pounds per square inch (psi). To save space, large values of psi have been converted to kips per square inch (ksi), where 1 ksi = 1000 psi. The metric tonne ($\text{kg} \times 10^3$) has sometimes been shown in megagrams (Mg). Some strictly scientific data are presented in SI units only.

To clarify some illustrations, only one set of units is presented on artwork. References in the accompanying text to data in the illustrations are presented in both SI-based and customary U.S. units. On graphs and charts, grids corresponding to SI-based units usually appear along the left and bottom edges. Where appropriate, corresponding customary U.S. units appear along the top and right edges.

Data pertaining to a specification published by a specification-writing group may be given in only the units used in that specification or in dual units, depending on the nature of the data. For example, the typical yield strength of steel sheet made to a specification written in customary U.S.

units would be presented in dual units, but the sheet thickness specified in that specification might be presented only in inches.

Data obtained according to standardized test methods for which the standard recommends a particular system of units are presented in the units of that system. Wherever feasible, equivalent units are also presented. Some statistical data may also be presented in only the original units used in the analysis.

Conversions and rounding have been done in accordance with IEEE/ASTM SI-10, with attention given to the number of significant digits in the original data. For example, an annealing temperature of 1570 °F contains three significant digits. In this case, the equivalent temperature would be given as 855 °C; the exact conversion to 854.44 °C would not be appropriate. For an invariant physical phenomenon that occurs at a precise temperature (such as the melting of pure silver), it would be appropriate to report the temperature as 961.93 °C or 1763.5 °F. In some instances (especially in tables and data compilations), temperature values in °C and °F are alternatives rather than conversions.

The policy of units of measure in this Handbook contains several exceptions to strict conformance to IEEE/ASTM SI-10; in each instance, the exception has been made in an effort to improve the clarity of the Handbook. The most notable exception is the use of g/cm^3 rather than kg/m^3 as the unit of measure for density (mass per unit volume).

SI practice requires that only one virgule (diagonal) appear in units formed by combination of several basic units. Therefore, all of the units preceding the virgule are in the numerator and all units following the virgule are in the denominator of the expression; no parentheses are required to prevent ambiguity.

Preface

The *ASM Handbook*, Volume 4A, *Steel Heat Treating Fundamentals and Processes*, represents the first of several Volumes to be published on heat treating. As indicated in the title, Volume 4A focuses on the fundamental aspects of steel heat treating and the many processes of steel heat treating. The Volume 4B, planned for future publication, will cover the heat treating and behavior of the many types of steels and cast irons.

As with the last edition of this Volume, the Volume Editors recognized that the researchers, engineers, technicians and students that will use this Volume 4A have different needs with regard to their level of understanding. Articles on the fundamentals provide in-depth background on the scientific principles associated with steel heat treatment, while articles on the various heat treating processes take a more practical approach. The Volume Editors have also tried to present a comprehensive reference that can be of use to the diverse heat treating community.

All sections of this Volume have been reviewed to be sure that they reflect the current status of the technology. Many sections have been expanded, such as the sections on fundamentals and processing methods for carburizing and nitriding of steels. Coverage on the hardenability of steels is expanded, and several new articles have been added on quenching fundamentals and processes. Updates have been done as appropriate, and efforts were taken to include charts, examples, and reference information from the substantive archives of the Society—and its predecessors—the American Society for Metals, and the American Society for Steel Treating. This Volume is especially fitting in the 100th anniversary year of ASM International.

We wish to thank our many colleagues who served as editors and authors of the individual articles. In particular, the editors also are indebted to the Heat Treating Society (An Affiliate Society of ASM International) and its members, which give the foundation for this publication and other events, conferences, and educational programs. This Volume would not have been possible without their efforts.

Jon Dossett
George Totten

Classification	282	Advantages	364
Forgings	284	Martempering Media.	364
Bar and Tubular Products	286	Safety Precautions	367
		Suitability of Steels for Martempering.	368
		Control of Process Variables	371

Dimensional Control	373	Application Tips and Troubleshooting	459
Applications	376	Electron Beam Surface Hardening	
Selection of Austenitizing Equipment	377	<i>Rolf Zenker and Anja Buchwalder</i>	462
Selection of Martempering Equipment	377	Electron Beam Generation and Interaction with Material.	462
Martempering Bath Maintenance	378	Processing Techniques	464
Racking and Handling	380	Electron Beam Hardening Technologies	466
Washing the Work	380	Electron Beam Facilities and Manufacturing Systems	
Cold and Cryogenic Treatment of Steel	382	with Integrated EB Facilities	469
Cold Treatment of Steel	382	Applications	471
Cryogenic Treatment of Steels	383	Laser Surface Hardening	
Case Hardening of Steels	387	<i>Soundarapandian Santhanakrishnan and Narendra B. Dahotre</i>	476
Introduction to Surface Hardening of Steels		Conventional Surface-Hardening Techniques	476
<i>Michael J. Schneider and Madhu S. Chatterjee</i>	389	Laser Surface Hardening	478
Diffusion Methods of Surface Hardening	389	Absorptivity	479
Carburizing and Carbonitriding	390	Laser Scanning Technology	480
Nitriding and Nitrocarburizing	393	Laser Annealing	481
Applied Energy Methods	395	Laser Cladding	481
Other Methods	396	Laser Shock Peening	483
Process Selection	397	Laser Heat Treatment	483
Stop-Off Technologies for Heat Treatment		Thermokinetic Phase Transformations	485
<i>Eckhard H. Burgdorf, Manfred Behnke, Rainer Braun,</i>		Challenges in Obtaining the Specified Hardness	487
<i>and Kevin M. Duffy</i>	399	Influence of Cooling Rate	488
Mechanical Masking	399	Effect of Processing Parameters on Temperature,	
Copper Plating	399	Microstructure, and Case Depth Hardness	488
Stop-off Paints	400	Laser Surface Hardening of Nonferrous Alloys	491
Methods of Measuring Case Depth in Steels		Carburizing and Carbonitriding of Steels	503
<i>William J. Bernard III.</i>	405	Introduction to Carburizing and Carbonitriding	
Introduction	405	<i>Allen J. Fuller, Jr.</i>	505
Measurement Specifications	405	Introduction	505
Chemical Method	406	History	505
Mechanical Methods	407	General Process Description	506
Visual Methods	411	How to Carburize	509
Nondestructive Methods	413	Basic Carburizing Reactions	510
Applied-Energy Case Hardening of Steels	417	Advantages and Limitations	512
Flame Hardening of Steels		Carburizing Steels	514
<i>B. Rivolta</i>	419	Quality Assurance	514
Methods of Flame Hardening	419	Possible Complications	516
Fuel Gases	421	Methods of Carburizing and Carbonitriding	518
Burners and Related Equipment	423	Evaluation of Carbon Control in Carburized Parts	
Operating Procedures and Control	426	<i>Gary D. Keil and Olga K. Rowan.</i>	522
Preheating	427	Hardness Testing	522
Depth and Pattern of Hardness	427	Microscopic Examination	522
Maintenance of Equipment	428	Analysis of Consecutive Cuts	523
Preventive Maintenance	431	Analysis of Shim Stock	524
Safety Precautions	431	Analysis of Rolled Wire	526
Quenching Methods and Equipment	431	Spectrographic Analysis	526
Quenching Media	432	Electromagnetic Testing	527
Flame-Hardening Problems and Their Causes	432	Gas Carburizing	
Tempering of Flame-Hardened Parts	433	<i>Olga K. Rowan and Gary D. Keil.</i>	528
Surface Conditions	433	Thermodynamics and Kinetics	528
Dimensional Control	433	Carbon Sources and Atmosphere Types	532
Selection of Process	433	Carbon-Transfer Mechanism	535
Selection of Material	435	Carburizing Modeling and Case Depth Prediction	536
Flame Annealing	436	Carburizing Equipment	538
Induction Surface Hardening of Steels		Furnace Temperature and Atmosphere Control	540
<i>Valery Rudnev and Jon Dossett</i>	438	Carburizing Cycle Development	544
Principles of Induction Heating	438	Process Planning	547
High-Temperature Electrical, Magnetic, and		Dimensional Control	555
Thermal Properties	440	Case Depth Evaluation	556
Eddy-Current Distribution	443	Pack Carburizing	560
Induction Hardening and Tempering	446	Introduction	560
General Equipment and Process Factors	451	Advantages and Disadvantages	560
Surface-Hardening Parameters	456	Carburizing Medium and Compounds	561
		Process Control	562
		Furnaces for Pack Carburizing	562
